MATH38011 - Linear Models

Year: 3 - Semester: 1 - Credit Rating: 10

Requisites

Prerequisites

MATH20701 Probability 2

MATH20802 Statistical Methods

Aims

- To familiarise students with the methodology and applications of standard techniques of regression analysis, and analysis of variance and covariance.
- To explore some of the wide range of real-life situations occurring in the fields of agriculture, biology, engineering, industrial experimentation, medical and social sciences that can be investigated using Linear Statistical Models.

Brief Description

In many areas of science, technology, social science and medicine one often wishes to explore the relationship between one observable random response and a number of 'factors' which may influence simultaneously the response. The techniques developed to study such relationships fall in three broad categories:

- Regression Analysis where the influence of the factors is quantitative;
- Analysis of Variance where each factor's influence is qualitative; and
- Analysis of Covariance where both qualitative and quantitative factors are present.

However, these three valuable techniques can be studied together as special cases of a unified theory of Linear Models. The course starts with a study of estimation and hypothesis testing in the general linear problem. Once the principles and techniques are established practical applications in the three types of analysis are examined in greater detail.

Learning Outcomes

On successful completion of this course unit students will be able to

- Fit linear models and comment on the adequacy of the fit;

- identify and apply appropriate transformations of either the response or of the covariates;
- check for and identify colinearities, and understand the implications of their presence;
- produce confidence intervals for linear combinations and ratios of linear combinations of the model parameters;
- formulate hypotheses in terms of the model parameters and construct test procedures for testing such hypotheses;
- use the statistical software R or S-PLUS to analyze real data through Linear Statistical Models.

Syllabus

- General Linear Models: Least squares estimators (l.s.e) and their properties. Residuals and residual sum of squares. Leverage. Distribution of l.s.e and of the residual sum of squares. [5]
- The general linear hypothesis. Extra sum of squares, sequential sum of squares, partial sum of squares. The test statistic of the general linear hypothesis and its distribution. Confidence intervals and prediction intervals. [5]
- Linear regression: Simple regression, multiple regression, dummy variables and analysis of covariance. [6]
- Analysis of Variance. One and two way analysis of variance. Use of comparisons. Interactions. [6]

Teaching & Learning Process (Hours Allocated To)

Lectures	Tutorials/ Example Classes	Practical Work/ Laboratory	Private Study	Total
22	11	0	67	100

Assessment and Feedback

- Coursework: weighting 20%
- End of semester examination: two hours weighting 80%
