MATH46052

Approximation Theory and Finite Element Analysis

Unit code:	MATH46052
Credit Rating:	15
Unit level:	Level 4
Teaching period(s):	Semester 2
Offered by	School of Mathematics
Available as a free choice unit?:	N

Requisites

Prerequisite

- [MATH20101 - Real and Complex Analysis](#) (Compulsory)
- [MATH20401 - Partial Differential Equations and Vector Calculus A](#) (Compulsory)

Additional Requirements

MATH46052 pre-requisites

Students are not permitted to take, for credit, MATH46052 in an undergraduate programme and then MATH66052 in a postgraduate programme at the University of Manchester, as the courses are identical.

Aims

To give an understanding of the fundamental methods and theoretical basis of approximation. To provide students with the technical tools enabling them to solve practical elliptic PDE problems using the finite element method.

Overview

This course unit covers the theory of approximation and applications to the numerical solution of linear elliptic partial differential equations (PDEs) using finite element approximation methods. Such methods are universally used to solve practical problems associated with physical phenomena in complex geometries. The emphasis is on assessing the accuracy of the approximation using a priori and a posteriori error estimation techniques. Practical issues will be illustrated with MATLAB using the IFISS software toolbox.

Assessment methods

- Other - 25%
- Written exam - 75%

Assessment Further Information

- Mid-semester coursework: 25%
- End of semester examination: three hours weighting 75%

Learning outcomes

Learning Outcomes

On successful completion of this course unit students will

- understand notions of best approximation in different norms and be able to find the best approximation;
- understand the concepts of weak and classical solutions of elliptic boundary value problems;
- understand the concept of piecewise polynomial approximation in two dimensions, and have an appreciation for the underlying error analysis;
- have an appreciation of the computational issues that arise when solving convection-diffusion problems;

Future topics requiring this course unit

None

Syllabus

1. Basics. Review of basic functional analysis concepts: norms, inner-products. Sobolev spaces. Weak derivatives. Lax-Milgram lemma. [3]

2. Linear approximation. Best approximation in L_p norms. Existence and uniqueness. Choice of norm in practical curve fitting. Least squares approximation and normal equations. Orthogonal basis functions. Overview of the cases $p=1$ and $p=\infty$. Choice of linear approximating functions. Polynomials, orthogonal polynomials, Chebyshev polynomials, Spline functions. Surface fitting by polynomials and splines, including the thin plate spline and radial basis functions.[8]

3. Finite element methods for the diffusion equation. Affine mappings. Linear, bilinear, quadratic and biquadratic approximation. Finite element assembly process. Properties of the discrete equation system. A priori error bounds: best approximation in energy, H^1 error bounds. H^2 regularity and singular problems. A posteriori error bounds. Local error estimators. Self adaptive refinement strategies. [14]

4. Finite element methods for the convection-diffusion equation. Well-posedness. Weak formulation. Galerkin approximation. The streamline-diffusion method. A priori and a posteriori error bounds. Self-adaptive refinement strategies for resolving layers. [5]

Feedback methods

Tutorials will provide an opportunity for students' work to be discussed and provide feedback on their understanding.

Study hours

- Lectures - 22 hours
- Tutorials - 11 hours
- Independent study hours - 117 hours

Teaching staff

David Silvester - Unit coordinator
